

Guide to opening Power BI from Anaconda

To enable Python scripts to run in Power BI using the packages you've already used in Jupyter Notebook you may need to open Power BI from Anaconda Navigator in order to connect Power BI to your Python environment.

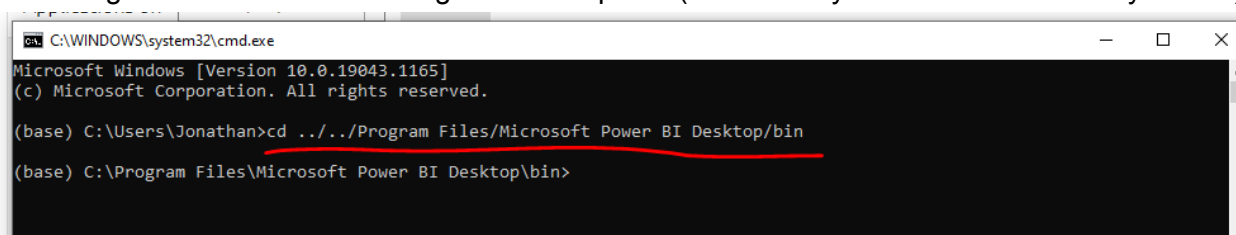

Step 1

Open Anaconda Navigator and launch 'CMD.exe Prompt'.

Step 2

Write the command '`cd ../../Program Files/Microsoft Power BI Desktop/bin`' and then press **Enter** to get to the folder containing PBIDesktop.exe (file directory could be different on your PC).

Step 3

Launch Power BI by writing the command '`start PBIDesktop.exe`' and then press **Enter**.
